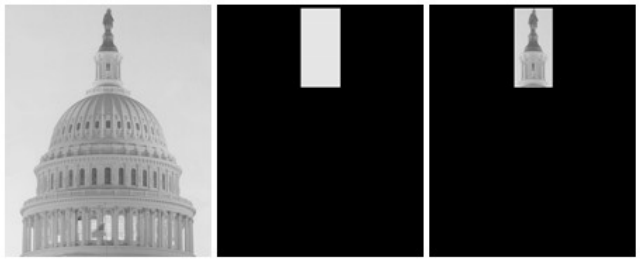
  - Median/max/min filters
  - Arithmetical/Logical operations
  - Binary image and morphological operations
- Image transforms

Arithmetical/Logical Operations

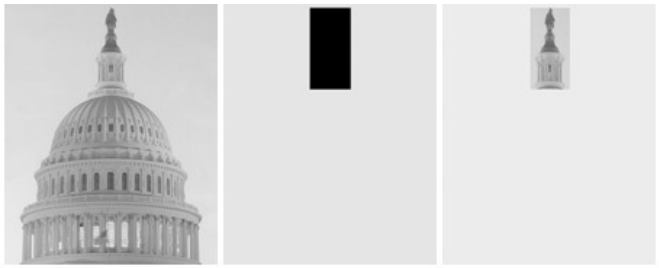
- AND operation
- OR operation
- Image subtraction
- Image addition

AND operation



Original | And mask | Output image

OR operation



Original | OR mask | Output image

Image Addition

- If f and g are two images, the pixelwise addition R is defined as:
  - R(x,y) = Min(f(x,y)+g(x,y) ; 255)
- Image addition is used to
  - lower the noise in a serie of images
  - increase the luminance by adding the image to itself

Source : Eric Favier. L'analyse et le traitement des images. ENISE.

Average Images

- g(x,y) is the addition of f(x,y) and noise $\eta(x,y)$

$$g(x,y) = f(x,y) + \eta(x,y)$$

- If we have several images {g(x,y)}, we can compute the average one

$$\bar{g}(x,y) = \frac{1}{K}\sum_{i=1}^{K} g_i(x,y)$$

Average Images

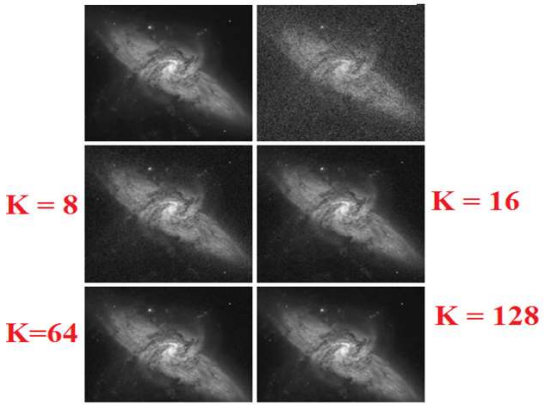


Image subtraction

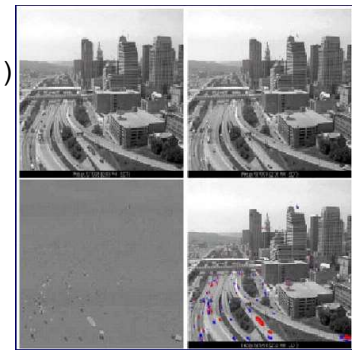
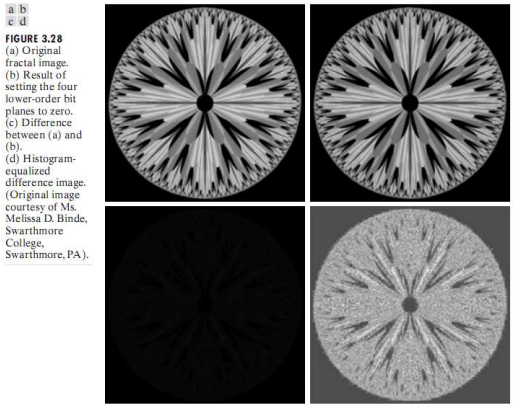
- The pixelwise substraction of two images f and g is:
  S(x,y) = Max(f(x,y)-g(x,y) ; 0)
- Image substraction is used to
  - detect defaults, detect difference between images
  - detect motion in images



Source : Eric Favier. L'analyse et le traitement des images. ENISE.

Image subtraction



a b
c d

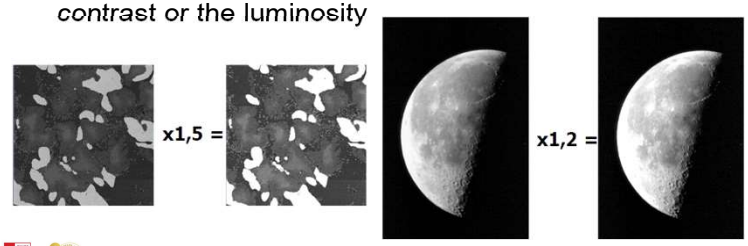
FIGURE 3.28
(a) Original fractal image. (b) Result of setting the four lower-order bit planes to zero. (c) Difference between (a) and (b). (d) Histogram-equalized difference image. (Original image courtesy of Ms. Melissa D. Binde, Swarthmore College, Swarthmore, PA).

Image subtraction

After detection, we still have some noise, that we can clean to keep only the object of interest

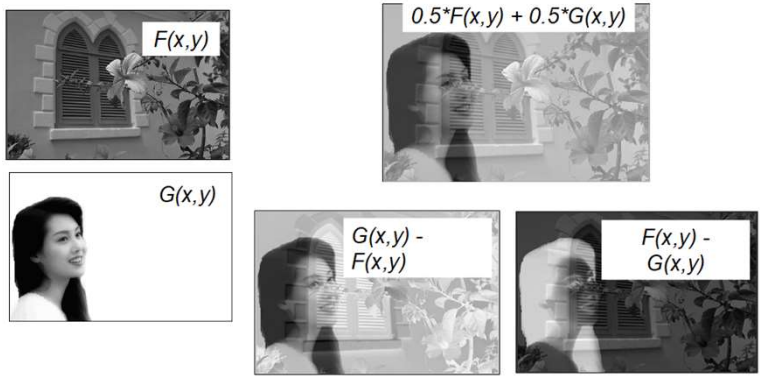
Image multiplication

- The multiplication S of an image f by a ratio (factor) is defined as:
  - S(x,y) = Max(f(x,y)*ratio ; 255)
- Image multiplication can be used to increase the *contrast or the luminosity*



Source : Eric Favier. L'analyse et le traitement des images. ENISE.

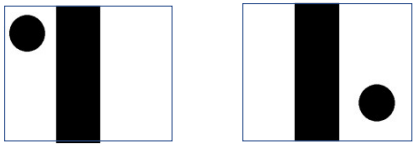
Operations on images



Source : www.nte.montaigne.u-bordeaux.fr/SuppCours/5314/Dai/TraitImage01-02.ppt

Exercise

- Given two images as bellow

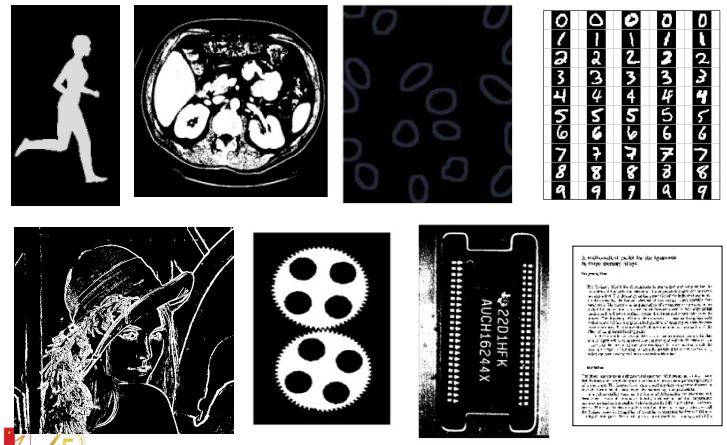


1. Transform images to negative ones
2. Process to have an image which has only the "ball"

Reference

- I1 = imread('images/ball1.png');
- >> I1 = rgb2gray(I1);
- >> I1 = 255 - I1;
- >> I2 = imread('images/ball2.png');
- >> I2 = rgb2gray(I2);
- >> I2 = 255 - I2;
- >> I3 = I1 + I2;
- >> I4 = image_substract(I1, I2);
- >> I5 = I4;
- >> I5(find(I4==-255))=255;
- >> I5 = uint8(I5);
- I6 = I3 - I5;
- I7 = I1 – I6;
- I8 = I2 – I6;

Binary images



Binary images

- Two pixel values: foreground (object, 1) and background (0)
- Be used
  - To mark region(s) of interest
  - As results of thresholding method

1	1	0	1	1	1	0	1
1	1	0	1	0	1	0	1
1	1	1	1	0	0	0	1
0	0	0	0	0	0	0	1
1	1	1	1	0	1	0	1
0	0	0	1	0	1	0	1
1	1	0	1	0	0	0	1
1	1	0	1	0	1	1	1

Thresholding

- Given a grayscale image or an intermediate matrix → threshold to create a binary output.

Example: edge detection

Gradient magnitude

```
fg_pix = find(gradient_mag > t);
```

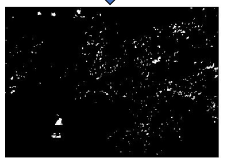
Looking for pixels where gradient is strong.

Thresholding

- Given a grayscale image or an intermediate matrix → threshold to create a binary output.

Example: background subtraction

Looking for pixels that differ significantly from the “empty” background.

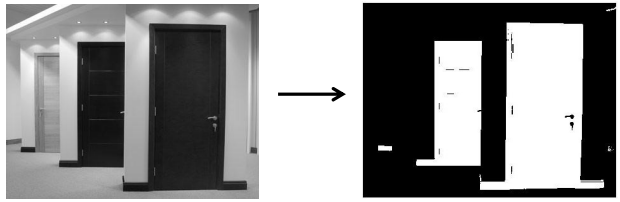


```
fg_pix = find(diff > t);
```

Thresholding

- Given a grayscale image or an intermediate matrix → threshold to create a binary output.

Example: intensity-based detection



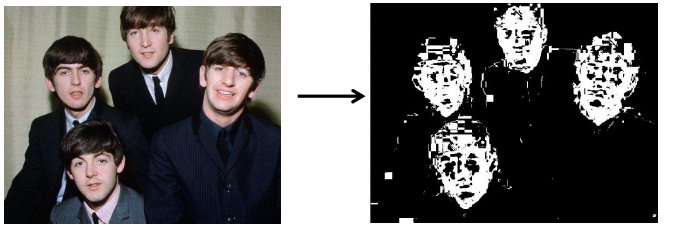
```
fg_pix = find(im < 65);
```

Looking for dark pixels

Thresholding

- Given a grayscale image or an intermediate matrix → threshold to create a binary output.

Example: color-based detection



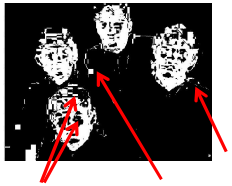
```
fg_pix = find(hue > t1 & hue < t2);
```

Looking for pixels within a certain hue range.

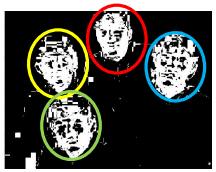
Slide credit: Kristen Grauman

Issues

- What to do with "noisy" binary outputs?
  - Holes
  - Extra small fragments



- How to demarcate multiple regions of interest?
  - Count objects
  - Compute further features per object



Slide credit: Kristen Grauman

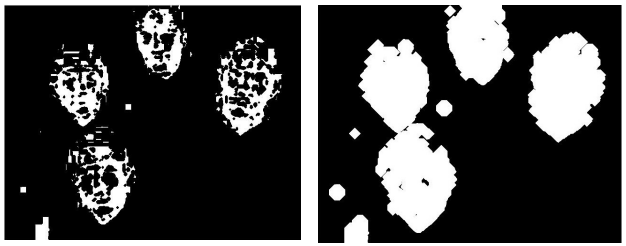
Morphological operators

- Change the shape of the foreground regions via intersection/union operations between a scanning structuring element and binary image.
- Useful to clean up result from thresholding

- Main components
  - Structuring element
  - Operators:
    - Basic operators: Dilation, Erosion
    - Others: Opening, Closing, …

Dilation

- Expands connected components
- Grow features
- Fill holes

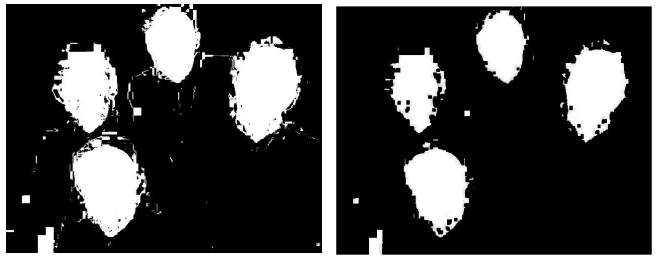


Before dilation | After dilation

Slide credit: Kristen Grauman

Erosion

- Erode connected components
- Shrink features
- Remove bridges, branches, noise

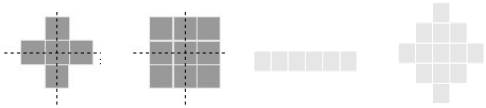


Before erosion | After erosion

Slide credit: Kristen Grauman

Structuring elements

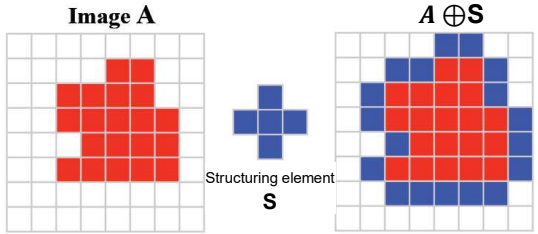
- **Masks** of varying shapes and sizes used to perform morphology, for example:



- Scan mask (structuring element) over the object (foreground) borders (inside and outside) and transform the binary image

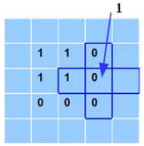
Dilation

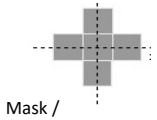
- Moving S on each pixel of A
  - check if the intersection (pixels belonging to object) is not empty
  - If yes, the center of B belongs to the result image
- If a pixel of S is onto object pixels (A), then the central pixel belongs to object
  - Otherwise (i.e. all pixels of are background), set to background (no change)



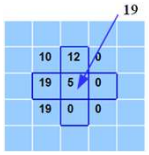
Dilation

- As max filter
- Can be applied both on
  - binary images
  - or grayscale images



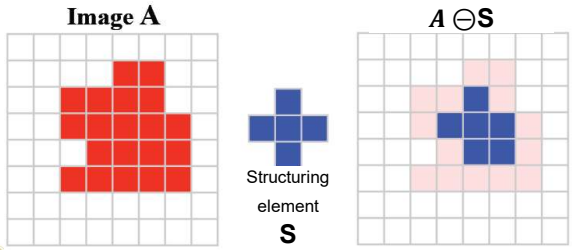


Mask /
Structuring element



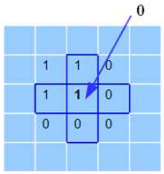
Erosion

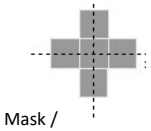
- We put the element S on each pixel x of A
  - like convolution
- If all pixels of S are onto object pixels (A), then the central pixel belongs to object
  - Otherwise (i.e. a mask pixel is background), set to background



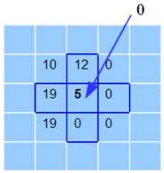
Erosion

- As min filter
- Can be applied both on
  - binary images
  - or grayscale images

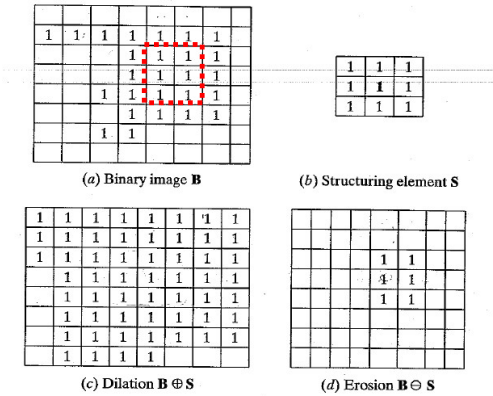




Mask /
Structuring element



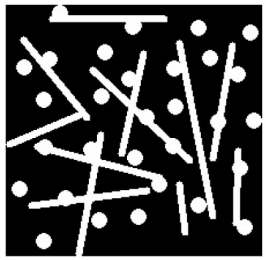
2D example



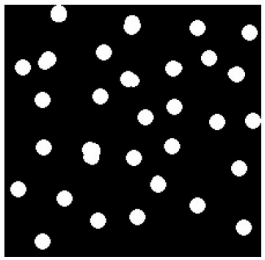
Shapiro & Stockman

Opening

- Erode, then dilate
- Remove small objects, keep original shape



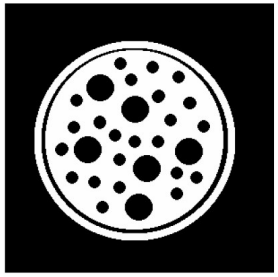
Before opening



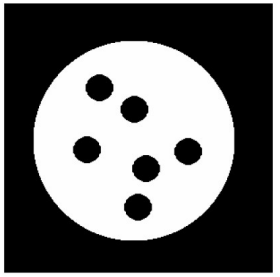
After opening

Closing

- Dilate, then erode
- Fill holes, but keep original shape



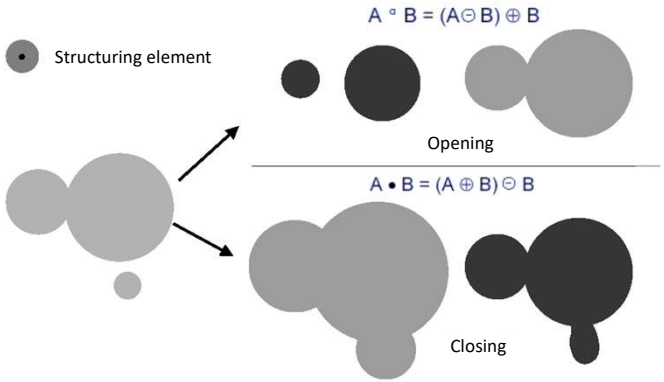
Before closing



After closing

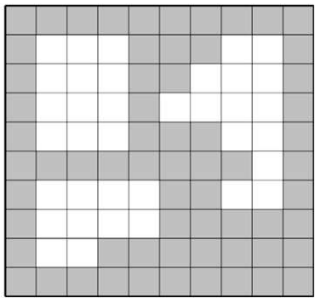
demo: http://bigwww.epfl.ch/demo/jmorpho/start.php

Opening vs Closing



Connected component labeling

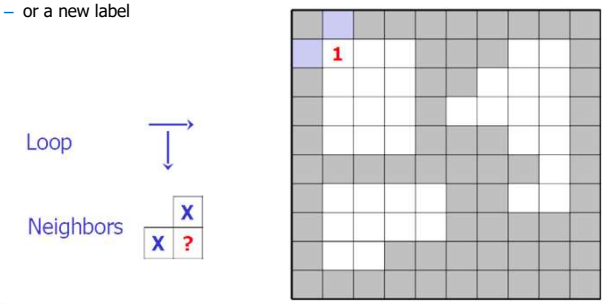
- We loop over all the image to give a unique number (label) for each region
- All pixels from the same region must have the same number (label)
- Objectifs:
  - Counting objects
  - Separating objets
  - Creating a mask for each object
  - ...



Connected component labeling

First loop over the image

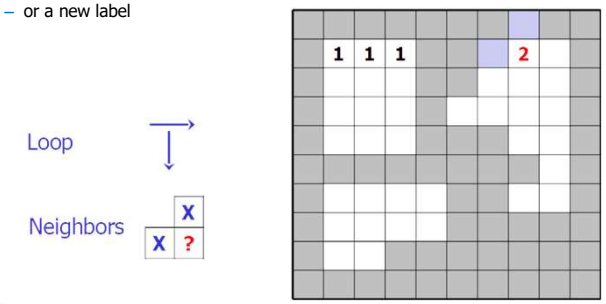
- For each pixel in a region, we set
  - or the smallest label from its top or left neighbors
  - or a new label



Connected component labeling

First loop over the image

- For each pixel in a region, we set
  - or the smallest label from its top or left neighbors
  - or a new label



SCHOOL OF INFORMATION AND COMMUNICATION TECHNOLOGY

Connected component labeling

First loop over the image

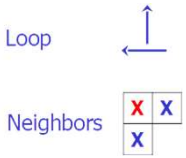
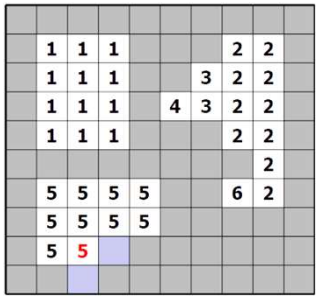
Second loop over the image

- For each pixel in a region, we set
  - the smallest from its own label and the labels from its down and right neighbors

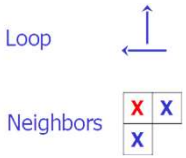


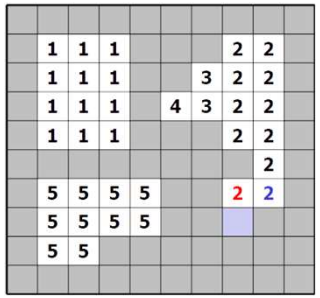


Connected component labeling

Second loop over the image

- For each pixel in a region, we set
  - the smallest from its own label and the labels from its down and right neighbors



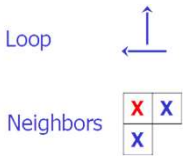


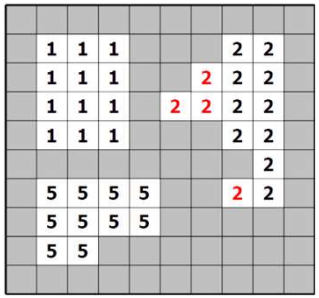
SCHOOL OF INFORMATION AND COMMUNICATION TECHNOLOGY

Connected component labeling

Second loop over the image

- For each pixel in a region, we set
  - the smallest from its own label and the labels from its down and right neighbors

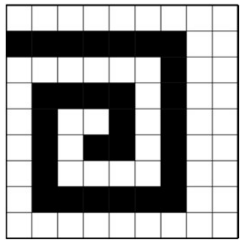




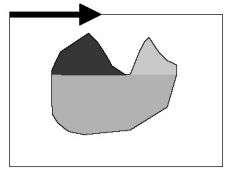
SCHOOL OF INFORMATION AND COMMUNICATION TECHNOLOGY

Connected component labeling

- Two loops are enough?
  - *example: spiral region !*



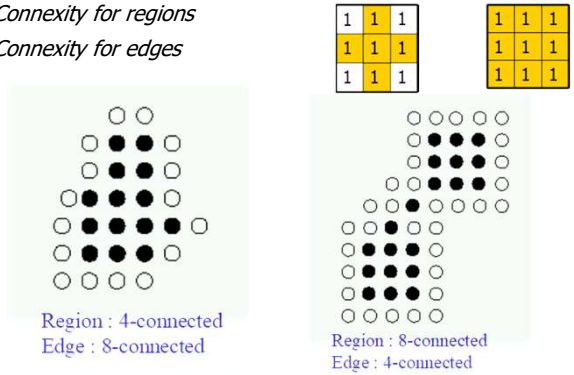
- Solutions
  - We continue, go and back two ways, until no new change in labels
  - It is possible to do only one loop: manage a table of equivalences when 2 different labels are neighbors



SCHOOL OF INFORMATION AND COMMUNICATION TECHNOLOGY

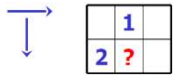
CC labeling: how many neighbors?

- Advice: Use different connexities for edges and regions
  - *4-Connexity for regions*
  - *8-Connexity for edges*

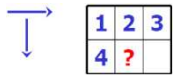


CC labeling: how many neighbors?

- Regions labeling
  - We use 4-connexity
  - Each loop, we compare 2 neighbors



- Edge labeling
  - 8-connexity
  - Each loop, we compare 4 neighbors



Content

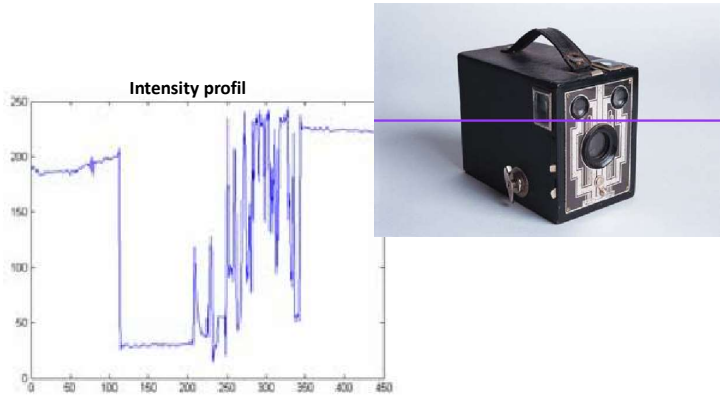
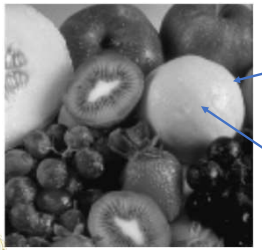
    - Frequencies in images
    - Fourrier transform
    - Frequential Processing (frequential filters)
  - PCA (additional reading)

Frequencies in images



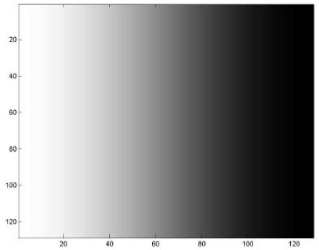
Frequencies in images

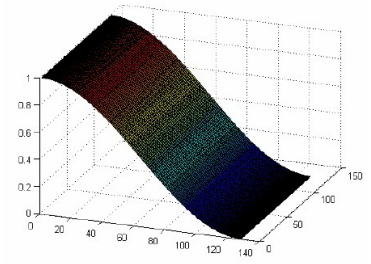
- What are the (low/high) frequencies in an image?
  - Frequency **= intensity change**
  - Slow changes (homogeneous /blur regions): low frequency
  - fast/abrupt changes (egde, contour, noise): high frequency



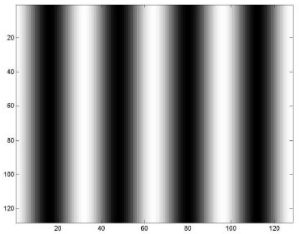
Most of energy concentrated in low frequencies

Low frequencies





High frequencies



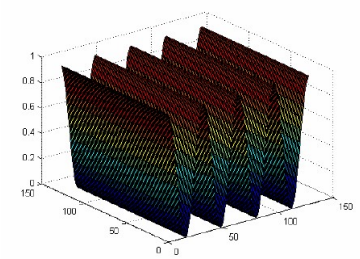


Image spectral analysis

- An image is a visual signal
  - We can analyse the frequencies of the signal
- How?
  - we will create a new « image » which will contains all frequencies of the image
    - Like a 2D frequency graphic
  - The basic tool for it is the **Fourier Transform**
- We talk about the **frequency domain**, opposing to the **spatial domain** (image)

Frequencies in a signal

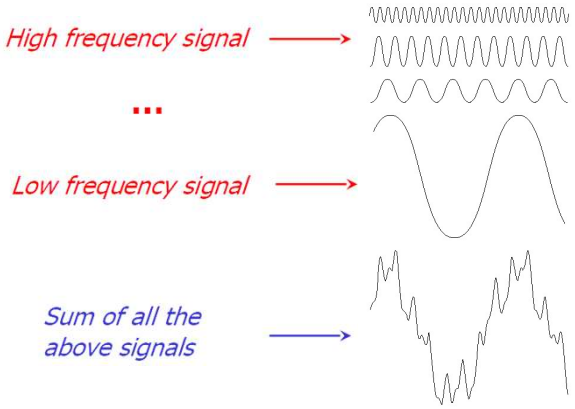

FIGURE 4.1 The function at the bottom is the sum of the four functions above it. Fourier's idea in 1807 that periodic functions could be represented as a weighted sum of sines and cosines was met with skepticism.

Source : Gonzalez and Woods. Digital Image Processing. Prentice-Hall, 2002.

Fourier series

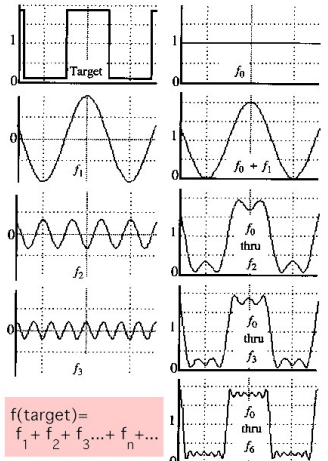
A bold idea (1807) - Jean Baptiste Joseph Fourier (1768-1830):

Any *univariate function can be rewritten as a weighted sum of sines and cosines of different frequencies.*

Our building block:

$$A\sin(\omega t) + B\cos(\omega t)$$

Add enough of them to get any signal *g(t)* you want!

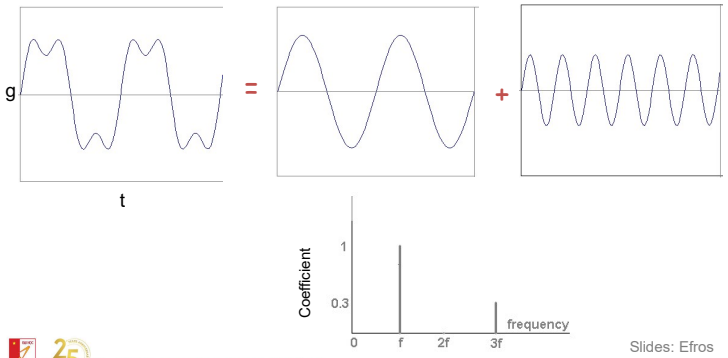


Hays

Example

$t = [0,2], f = 1$

$g(t) = \sin(2\pi f\, t) + (1/3)\sin(2\pi(3f)\, t)$



Slides: Efros

Fourier Transform

- Fourier transform is a mathematical transform that
  - Decomposes functions depending on space or time into functions depending on spatial or temporal frequency

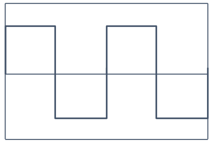
Slide by Alexei A. Efros

Fourier Series



We want to get this function

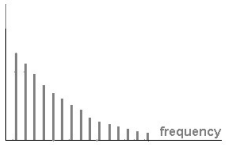
$$= A\sum_{k=1}^{\infty}\frac{1}{k}\sin(2\pi kt)$$

We'll get there in the limit



Slide by Alexei A. Efros

The math

Fourier Transform : $F(\omega) = \int_{-\infty}^{+\infty} f(x)e^{-i\omega x}dx$

Inverse Fourier Transform : $f(x) = \frac{1}{2\pi}\int_{-\infty}^{+\infty} F(\omega)e^{i\omega x}d\omega$

- Where are the sines and cosines? $e^{i\omega x} = \cos(\omega x) + i\sin(\omega x)$
- The result is a complex function $F(\omega) = R(\omega) + iI(\omega)$
- We've been showing only the **amplitude A (spectre)** so far:
- Phase is also encoded: $A = \pm\sqrt{R(\omega)^2 + I(\omega)^2}$

$$\phi = \tan^{-1}\frac{I(\omega)}{R(\omega)}$$

Slide by Steve Seitz

Magnitude and phase

- Fourier transform stores the **magnitude** and **phase** at each frequency
  - Magnitude encodes how much signal there is at a particular frequency
  - Phase encodes spatial information (indirectly)
  - For mathematical convenience, this is often notated in terms of real and complex numbers

Amplitude:

$$A = \pm\sqrt{R(\omega)^2 + I(\omega)^2}$$

Phase:

$$\phi = \tan^{-1}\frac{I(\omega)}{R(\omega)}$$

Slide by Rober Pless

Discrete Fourier transform

$$H_{f_j} = \frac{1}{N}\sum_k h_{t_k} e^{2\pi i f_j t_k}$$

$$h_{t_j} = \frac{1}{N}\sum_k H_{f_k} e^{-2\pi i f_k t_j}$$

where the t_k are the time corresponding to my signal in the time domain h_{t_k}, f_k are the corresponding frequency to my signal in the frequency domain, and N is the number of points of the signal data.

Image filtering in the frequential domain

- We will be dealing only with functions (images) of finite duration so we will be interested only in Fourier Transform

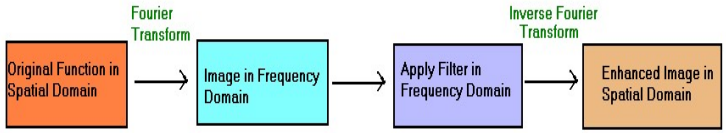

Image filtering in frequential domain

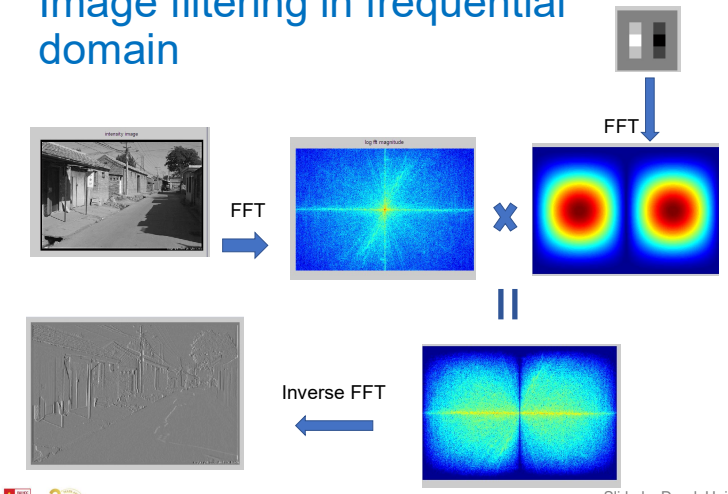
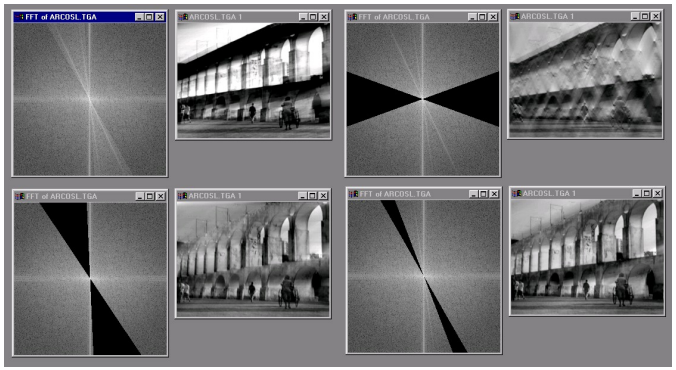
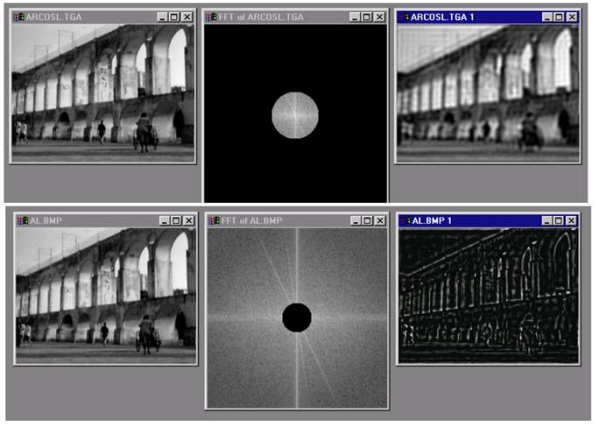


Slide by Derek Hoiem

Now we can edit frequencies!

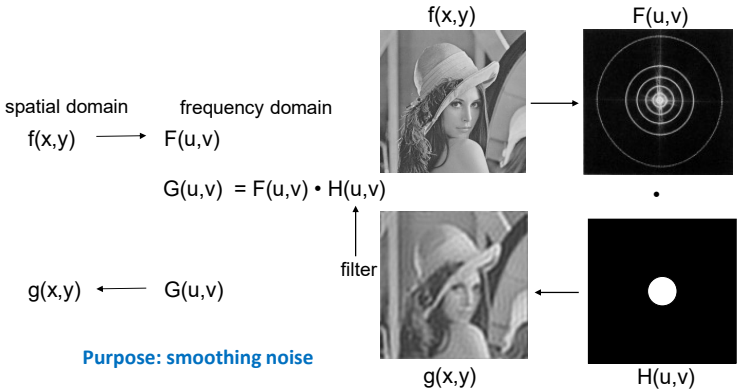


Low-pass and high-pass filtering



Slide by Alexei Efros

Low-pass filter

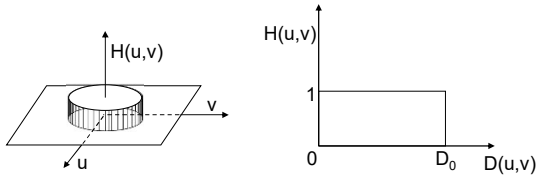


H(u,v) - Ideal low-pass filter

$$H(u,v) = \begin{cases} 1 & D(u,v) \le D_0 \\ 0 & D(u,v) > D_0 \end{cases}$$

$D(u,v) = \sqrt{u^2 + v^2}$

D_0 = cut off frequency



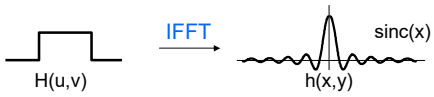
Blurring - Ideal low-pass filters

The ringing problem

$$G(u,v) = F(u,v) \bullet H(u,v)$$

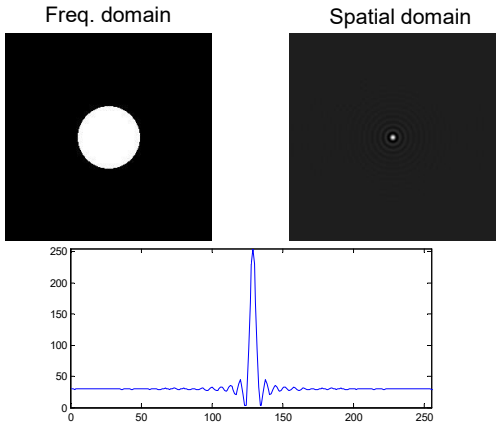
Convolution Theorem

$$g(x,y) = f(x,y) * h(x,y)$$

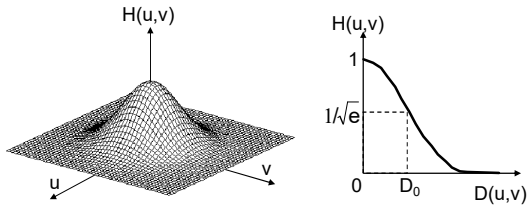


$\uparrow D_0 \longrightarrow \downarrow$ Ringing radius + $\downarrow$ blur

The ringing problem



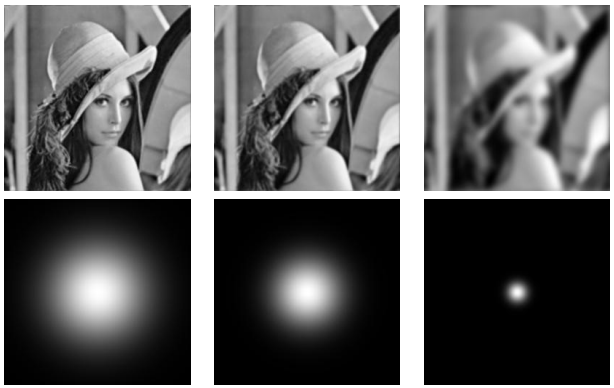
H(u,v) - Gaussian filter



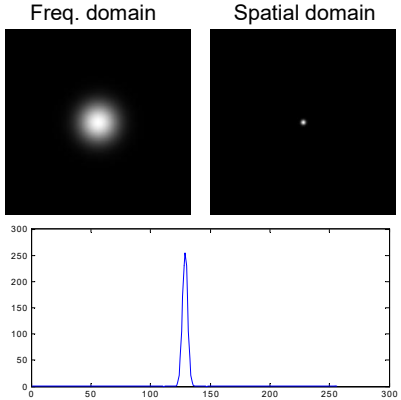
$H(u,v) = e^{-D^2(u,v)/(2D^2_0)}$ $D(u,v) = \sqrt{u_2 + v_2}$

Softer Blurring + no Ringing

Blurring - Gaussain lowpass filter

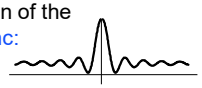


The Gaussian lowpass filter



Blurring in the Spatial Domain

Averaging = convolution with $\begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}$ = point multiplication of the transform with sinc:



Gaussian Averaging = convolution with $\begin{bmatrix} 1 & 2 & 1 \\ 2 & 4 & 2 \\ 1 & 2 & 1 \end{bmatrix}$

= point multiplication of the transform with a gaussian.

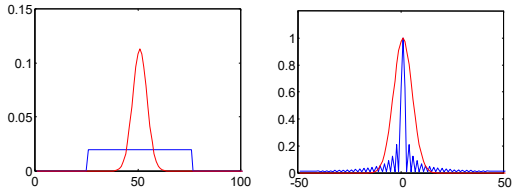


Image Domain Frequency Domain

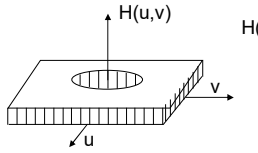
High-pass filter

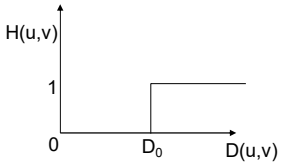
H(u,v) - Ideal Filter

$$H(u,v) = \begin{cases} 0 & D(u,v) \le D_0 \\ 1 & D(u,v) > D_0 \end{cases}$$

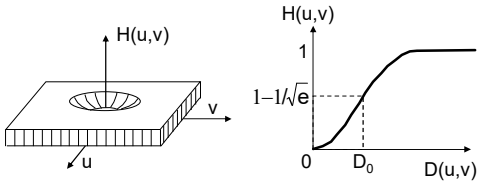
$D(u,v) = \sqrt{u^2 + v^2}$

D_0 = cut off frequency





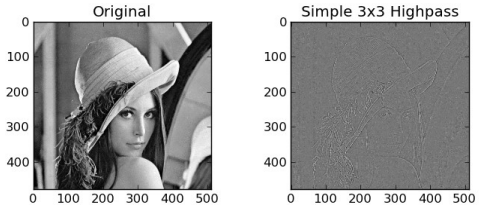
High-pass gaussian filter



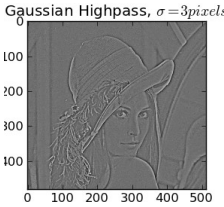
$$H(u,v) = 1 - e^{-D^2(u,v)/(2D^2_0)}$$

$$D(u,v) = \sqrt{u_2 + v_2}$$

High-pass filtering



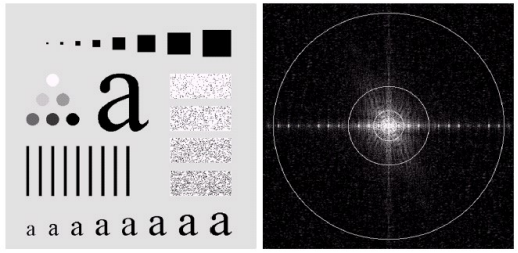
$$h_1(3x3) = \begin{bmatrix} -1 & -1 & -1 \\ -1 & 8 & -1 \\ -1 & -1 & -1 \end{bmatrix}$$



High pass filtering

Original image

Spectre with filters

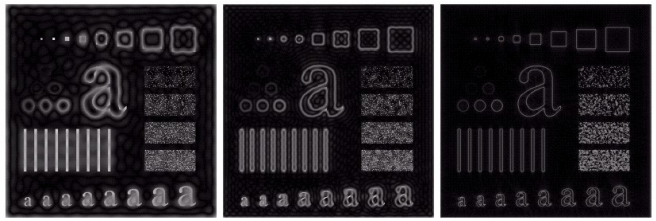


a b

FIGURE 4.11 (a) An image of size 500 × 500 pixels and (b) its Fourier spectrum. The superimposed circles have radii values of 5, 15, 30, 80, and 230, which enclose 92.0, 94.6, 96.4, 98.0, and 99.5% of the image power, respectively.

Source : Gonzalez and Woods. Digital Image Processing. Prentice-Hall, 2002.

High pass filtering



a b c

FIGURE 4.24 Results of ideal highpass filtering the image in Fig. 4.11(a) with D_0 = 15, 30, and 80, respectively. Problems with ringing are quite evident in (a) and (b).

Source : Gonzalez and Woods. Digital Image Processing. Prentice-Hall, 2002.

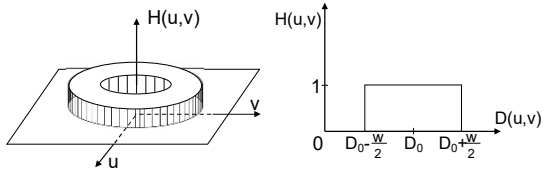
Band-pass filtering

$$H(u,v) = \begin{cases} 0 & D(u,v) \le D_0 - \frac{W}{2} \\ 1 & D_0 - \frac{W}{2} \le D(u,v) \le D_0 + \frac{W}{2} \\ 0 & D(u,v) > D_0 + \frac{W}{2} \end{cases}$$

$D(u,v) = \sqrt{u^2 + v^2}$

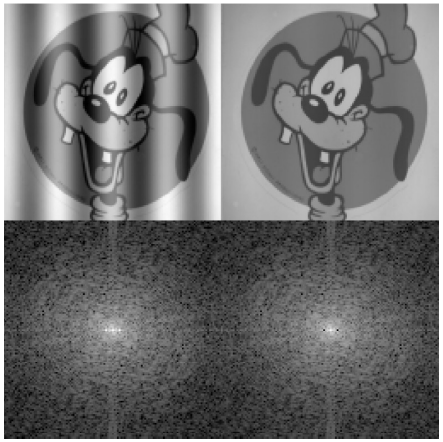
D_0 = cut off frequency

w = band-width



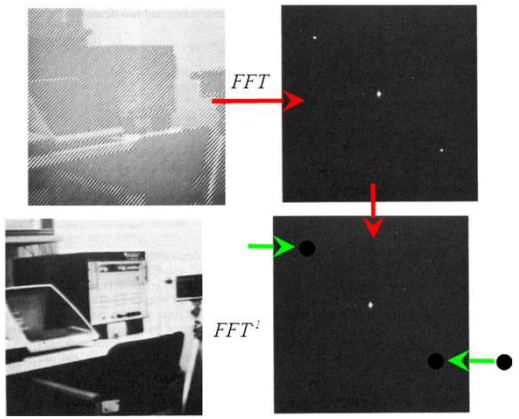
Can be obtained by multiplying the filter functions of **a low-pass and of a high-pass** in the frequency domain

Removing sinus noise

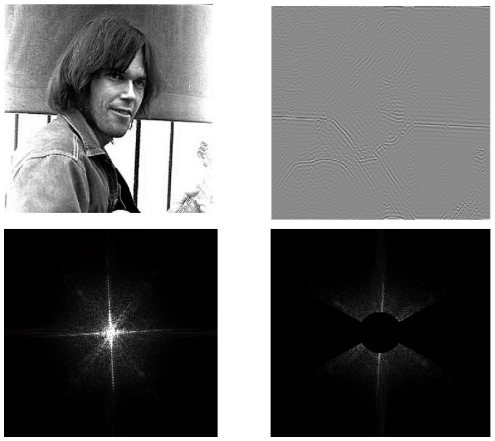


Brayer

Removing sinus noise



High-pass filtering + orientation



Hybrid Images

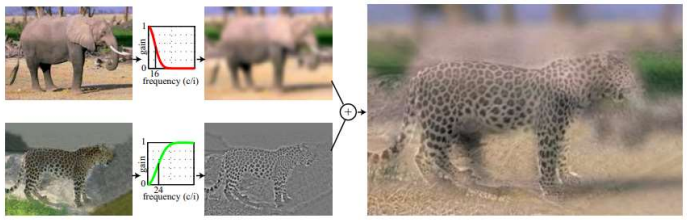


Figure 2: hybrid images are generated by superimposing two images at two different spatial scales: the low-spatial scale is obtained by filtering one image with a low-pass filter, and the high spatial scale is obtained by filtering a second image with a high-pass filter. The final hybrid image is composed by adding these two filtered images.

A. Oliva, A. Torralba, P.G. Schyns, SIGGRAPH 2006

Content

- Rappel: digital image representation
- Point Processing
- Convolution and Linear filtering
- More neighborhood operators
- Image transforms
  - Frequency domain
  - PCA (additional reading)
    - PCA
    - Example of using PCA for face recognition

Principle Component Analysis - PCA (Karhunen-Loeve transformation)

- **PCA** transforms the original input space into a lower dimensional space
  - By constructing dimensions that are linear combinations of the given features
- The objective: consider independent dimensions along which data have largest variance (i.e., greatest variability)

Slide by Jana Kosecka

Principal Component Analysis (cont.)

- **PCA** enables transform a number of possibly correlated variables into a smaller number of uncorrelated variables called principal components
- The first principal component accounts for as much of the variability in the data as possible
- Each succeeding component (orthogonal to the previous ones) accounts for as much of the remaining variability as possible

Slide by Jana Kosecka

Principal Component Analysis (cont.)

- PCA is the most commonly used dimension reduction technique.
- Data samples $x_1, \cdots, x_N$
- Compute the mean $\bar{x} = \frac{1}{N}\sum_{i=1}^{N} x_i$
- Computer the covariance matrix:

$$\Sigma_x = \frac{1}{N}\sum_{i=1}^{N}(x_i - \bar{x})(x_i - \bar{x})^T$$

Slide by Jana Kosecka

Principal Component Analysis (cont.)

- Compute the eigenvalues λ and eigenvectors e of the matrix Σ_x
- Solve $\Sigma_x x = \lambda x$
- Order them by magnitude:

$$\lambda_1 \geq \lambda_2 \geq .\lambda_N.$$

- PCA reduces the dimension by keeping direction e such that $\lambda < T$.

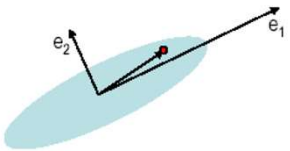
Slide by Jana Kosecka

Principal Component Analysis (cont.)

- For many datasets, most of the eigenvalues are negligible and can be discarded.

The eigenvalue λ measures the variation
In the direction of corresponding eigenvector

Example:
$\lambda_1 \neq 0, \lambda_2 = 0.$



Slide by Jana Kosecka

Principal Component Analysis (cont.)

- How to get uncorrelated components which Capture most of the variance
- Project the data onto the selected eigenvectors:

$$y_i = e_i^T (x_i - \bar{x})$$

- If we consider first M eigenvectors we get new lower dimensional representation

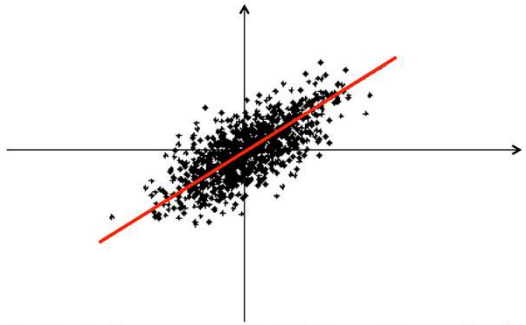
$$[y_1, \cdots, y_M]$$

- Proportion covered by first M eigenvalues

$$\frac{\sum_{i=1}^{M} \lambda_i}{\sum_{i=1}^{N} \lambda_i}$$

Slide by Jana Kosecka

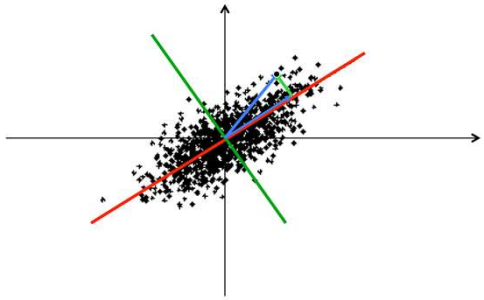
Illustration of PCA



First principal component of a two-dimensional data set.

Slide by Jana Kosecka

Illustration of PCA



Second principal component of a two-dimensional data set.

Slide by Jana Kosecka

Determining the number of components

- Plot the eigenvalues
  - each eigenvalue is related to the amount of variation explained by the corresponding axis (eigenvector)
  - If the points on the graph tend to level out (show an "elbow" shape), these eigenvalues are **usually close enough to zero that they can be ignored**

Slide by Jana Kosecka

Content

- Rappel: digital image representation
- Point Processing
- Convolution and Linear filtering
- More neighborhood operators
- Image transforms
  - Frequency domain
  - PCA (additional reading)
    - PCA
    - Example of using PCA for face recognition

The space of all face images

- When viewed as vectors of pixel values, face images are extremely high-dimensional
  - 100x100 image = 10,000 dimensions
- However, relatively few 10,000-dimensional vectors correspond to valid face images
- We want to effectively model the subspace of face images

Slide by Jana Kosecka

Eigenfaces: Key idea

- Assume that most face images lie on a low-dimensional subspace determined by the first k ($k<d$) directions of maximum variance
- Use PCA to determine the vectors or "eigenfaces" $\mathbf{u}1,\ldots,\mathbf{u}k$ that span that subspace
- Represent all face images in the dataset as linear combinations of eigenfaces

Slide by Jana Kosecka

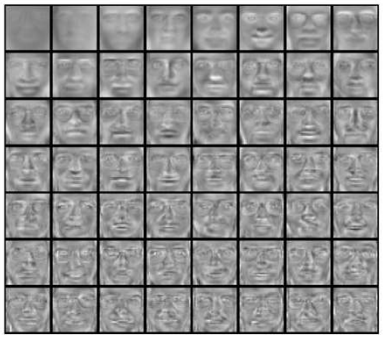
Eigenfaces example- Traning images

Slide by Jana Kosecka

Eigenfaces example

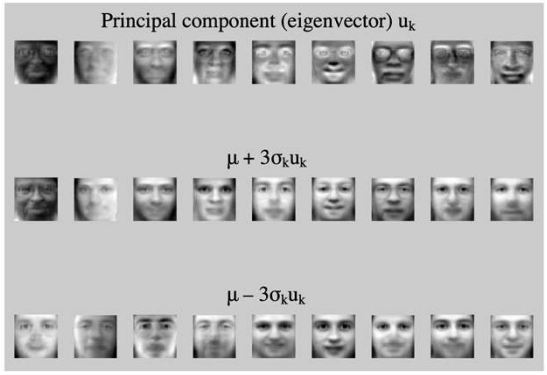
Top eigenvectors: $u_1,\ldots u_k$

Mean: μ



Slide by Jana Kosecka

Eigenfaces example



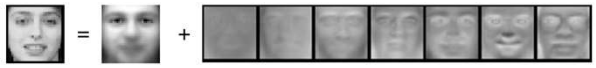
Slide by Jana Kosecka

Eigenfaces examples

- Representation

$$(w_{i1},\ldots,w_{ik}) = (\mathbf{u}_1^T(\mathbf{x}_i - \boldsymbol{\mu}), \ldots, \mathbf{u}_k^T(\mathbf{x}_i - \boldsymbol{\mu}))$$

- Reconstruction



$$\hat{\mathbf{x}} = \boldsymbol{\mu} + w_1u_1+w_2u_2+w_3u_3+w_4u_4+ \ldots$$

Slide by Jana Kosecka

Recognition with eigenfaces

- Process labeled training images:
- Find mean μ and covariance matrix Σ
- Find k principal components (eigenvectors of Σ) $\mathbf{u}_1,\ldots\mathbf{u}_k$
- Project each training image $\mathbf{x}_i$ onto subspace spanned by principal components:
  $(w_{i1},\ldots,w_{ik}) = (\mathbf{u}_1^T(\mathbf{x}_i - \mu), \ldots, \mathbf{u}_k^T(\mathbf{x}_i - \mu))$

- Given novel image $\mathbf{x}$:
- Project onto subspace:
  $(w_1,\ldots,w_k) = (\mathbf{u}_1^T(\mathbf{x} - \mu), \ldots, \mathbf{u}_k^T(\mathbf{x} - \mu))$
- Optional: check reconstruction error $\mathbf{x} - \hat{\mathbf{x}}$ to determine whether image is really a face
- Classify as closest training face in k-dimensional subspace

Slide by Jana Kosecka
